### ABSTRACT

A catalog of reports of lunar events, or temporary changes on the moon, has been compiled based on literature covering more than four centuries. In most cases, the original reference has been consulted; Houzeau and Lancaster's *Bibliographie Général d'Astronomie* and the *Astronomischer Jahresbericht* were useful secondary sources. Each entry includes a brief description and date of the observation, the name of the observer(s), where these are known, and the reference.

and Barbara L. Welther‡

### INTRODUCTION

A catalog of reports of lunar events, or temporary changes on the moon, has been compiled based on literature covering more than four centuries. In the majority of cases the original reference has been consulted; secondary sources such as the new (1964) edition of Houzeau and Lancaster's *Bibliographie Général d'Astronomie* and the *Astronomischer Jahresbericht* were also used. Each entry includes a brief description and date of the observation, the name of the observer(s), where these are known, and the reference. The purpose of this catalog is to provide a listing of historical and modern records that may be useful in investigations of possible activity on the moon.

### DESCRIPTION OF THE CATALOG

A lunar event is defined here as a temporary change, other than that due merely to conditions of illumination, in the appearance of a lunar feature involving a limited area, generally a few kilometers in dimension. Reports of observations of temporary bright spots, as well as veils, obscurations, and brightening of the floors of craters and other small areas have been included. No reports of apparently long-term changes are given; many of these have been reported for sites such as Messier, Linné, and Bartlett, but in most cases, the evidence is not conclusive for real changes, as it involved conflicting reports of the craters' appearances over periods of years, rather than changes actually in progress.

The catalog contains all information available to us through October 1967; many of the reports listed are taken from publications that are not now generally available. Column 1 gives a running number, column 2 the date of the occurrence, Gregorian except for the first entry which predates

<sup>\*</sup>Lunar and Planetary Laboratory, University of Arizona, Tucson, Arizona.

<sup>†</sup>Armagh Planetarium, Armagh, Northern Ireland.

<sup>‡</sup>Smithsonian Astrophysical Observatory, Cambridge, Massachusetts.

the use of the Gregorian calendar\* and the time at 0° longitude except where otherwise noted, column 3 the site and duration of the event, column 4 a short description of the phenomenon, column 5 the observer, and column 6 the reference. The references are given alphabetically following the catalog. Where permanent records (e.g., photographs, spectra, or photometric or spectrometric records) exist, a footnote is given.

Due to the form of the data presentation the maximum duration of the changes as listed covers a few hours only; nevertheless, it may not properly represent the total period of activity in the site. Many cases of reports for the same site on consecutive or nearly consecutive nights are given, and weather and other factors may have limited the observing period within a single night.

Throughout the catalog the use of the terms "east" and "west" follows the convention adopted by the International Astronomical Union (IAU) in 1961 in which the classical, or astronomical, "east" was changed to the astronautical "west", which is in agreement with ordinary terrestrial mapping with east at right and west at left.

As far as possible, we eliminated reports of events that, for one reason or another (e.g., possibly because of special lighting effects, multiple reflections, and changes of appearance caused by libration), are considered to be spurious. Reports of this type are discussed in the following section. In a large number of the historical cases, the high stature of the observer as a scientist inspires confidence in the reliability of the report and, for the rest, we saw no reason to dismiss the observation except in the cases listed in the next section. Almost certainly some doubtful cases remain listed in the catalog. However, their distribution with respect to almost any non-observational lunar variable is probably random, and we believe that statistically they are unimportant.

The fraction of past events which is recorded in the available literature is difficult to assess. Over the years, interest in lunar matters, and particularly in changes and events, has waxed and waned. Wars have intervened, and bad weather cycles have undoubtedly reduced the amount of observing at times. The number of observed lunar events is influenced by many other factors, such as the light-gathering power and resolution of the telescope used, the amount of time devoted to observation, and the skill and experience of the observers. It is notable that a marked increase in the frequency of the reports occurs from 1783 to 1800 following Herschel's observations of "lunar volcanoes" on May 4, 1783. This increase is almost certainly due to the interest generated among astronomers in England, France, and Germany. The gap between 1800 and 1821 correlates with unrest in Europe where most astronomers of that period lived. In 1813 the Napoleonic armies returning from Moscow overran and destroyed Schröter's observatory, home, and many of his later manuscripts. The time was a difficult one for science, and few advances in astronomy were made.

Reports of dark-side events are more frequent among the earlier observations, when the light-gathering power of most telescopes was relatively small and the field often included the image of

<sup>\*</sup>Adopted in 1582 in Catholic countries, but not until 1752 in England and her colonies, and in 1923 in Russia and other Eastern Orthodox countries.

the whole moon. Operation Moon Blink (described elsewhere, e.g., Association of Lunar and Planetary Observers (ALPO) reports) and similar undertakings in other countries helped increase the frequency of reports of lunar events during the last few years. The frontispiece shows the topographical distribution of sites of reported lunar events.

### REPORTS OMITTED FROM THE CATALOG

We attempted to eliminate all doubtful reports from this catalog. Less than full realization by the observers of the effects of changing conditions of illumination and other factors may have resulted in erroneous reports. Hazards of illumination include earthshine (strongest during the first and last three days of a lunation), sunshine on peaks just beyond the terminator, differences in albedo and color in small regions, and multiple reflections from crater walls. Careless reporting has been discovered in one case only (Hammes 1878, see below).

The following records are reports in which special appearances may be due to unusual lighting conditions or other temporary effects external to the moon, or which are unacceptable for other reasons. These reports are not included in the catalog.

1789 July 30. J. H. Schröter (1791, Selenotopographische Fragmente) "soon after sunrise" saw a kind of ferment on the floor of Plato which clearly resembled a kind of twilight.

1856 April 8, and 1860 April 24. J. Schmidt (1879, *Vierteljahrschrift für Astronomie*, 14, 265) noted weak glows in the crater Boussingault, but he doubted that these were more than sunlight on the walls re-reflected from the floor.

1878 November 12, 8:30 local time. John Hammes and friends in Iowa reported seeing a lunar "volcano." Correspondence in *Scientific American* (Dec. 21, 1878, 39, 385) includes drawings, an identification by Admiral Rogers of the supposed location, and a certification of John Hammes' respectability and good standing by the Mayor and three other citizens of Koekuk, Iowa. On investigation, it became clear that some of Hammes' details were incorrect, and since his drawings showed such poor detail, the site identification is questionable.

1899 August 29. P. Fauth (1899, *Astr. Nach.*, *151*, 219) noted that the inner parts of Copernicus glowed in weak phosphorescent light though not directly lighted by the sun. The observer noted, however, that the effect was probably due to multiple reflection, as the sun was then shining on the walls of the crater.

1909 January 24 and 25. Krebs (1909, *Astr. Nach.*, *181*, 45) and Nicolis noted that the non-illuminated part of the moon glowed red. These observations may have been due to special effects in the earth's atmosphere. Some eclipse reports originally included have been omitted from the list for similar reasons. Only where the observers described clearly bounded bright areas or rapid changes in brightness have eclipse observations been listed.

1964 - . Where the observations record progressive changes (on a number of occasions) by a succession of observers, apparently without adequate checks on subjectiveness, we felt sufficient doubt of the reality of a lunar event to omit the report.

In spite of the care taken, we may have wrongly included (or excluded) a number of items, but we believe that the total of these is quite small. For additional evidence in regard to the list of reported events, the following critical discussions and references are given:

### **ACKNOWLEDGMENTS**

We wish to record with gratitude help given by Miss C. Botley and others in locating many old journals and the contributions of data by Drs. J. Larink, J. A. O'Keefe, P. Treanor, Mrs. W. Cameron and many others. Mr. E. Whitaker kindly checked the evaluation of lighting conditions. Thanks are due for the kindness that made many items freely available for checking, especially in the libraries of Harvard Observatory, Kitt Peak National Observatory, and the Royal Astronomical Society. The support of the National Science Foundation through Grants GP-5940 and GP-6709 is gratefully acknowledged by B. M. Middlehurst. Mrs. Betty Fink assisted in the library search, in checking references and in preparing the manuscript for publication.

Description	Bright spot.	Black moving haze or cloud.	Cloud less intense.	Speckled with minute dots and streaks of light.	Bright spot.	Bright spot, 9th to 10th mag.	Two straight lines of light; a band between covered with luminous points.	Smoky-gray mist.	Twilight.	Dark mist.	During solar eclipse, moon's disk occasionally crossed by bright streaks.	On terminator saw an unusually bright spot that glowed like a fixed star.	A bluish glimmering patch of light, not quite within the night side of the moon.	Large luminous spots on dark side.	A bright spot about 1/4-ang diam of Saturn was perceived which, though it varied in intensity like an intermittent light, was at all times visible (dark side).	During eclipse, rapid changes in red color. (Lunar eclipse.)

Description	Without normal shadow.	Two luminous fiery spots on bright side. "an appearance I had never seen before on the surface of the moon though I have observed her often these last 40 years It appeared to me from the brightness of the light and the contrast of colour, to be two active volcances or 2 mouths of one in action."	Traces of twilight seen. Webb gives low weight to observation "for want of better optical means."	"During [lunar] eclipse, the E [IAU:W] side dark brick red and something seemed to oscillate before it." At mid-eclipse on the S side, "a very small meniscus was seen nearly the color of the uneclipsed moon."	Bright cloud.	Bright spot.	Bright spot like 4th mag star slightly out of focus. Bright speck remained changeless for 30 min, and its light was steady.	Point of light like star. Whole of Mare Crisium intersected with bright veins, mixed with bright spots of light. Aperture 4-1/2 in.; 4 hr before full moon.	Point of light like star, with misty cloud.	Dark side, distinct bright speck like 8th mag star.

Description	Faint but unmistakable white cloud, not seen before.	"Odd misty look as if vapour were in or about them."	White patch.	Cloudy appearance.	Foggy. Fog extended into the floor of Fracastorius. Gruithuisen said that the seeing was unsatisfactory.	Very bright (~8.0 mag star) with pulsations.	"Two pyramidal luminous protuber- ances appeared on the moon's limb These points were a little darker than the rest of the moon's face. They slowly faded away"	Whole region between Aristarchus and Herodotus and S part of Great Rille (Schröter's Valley) appeared in strong violet light as if covered with fog.	During eclipse, Aristarchus was a white spot in the coppery disk and continued so. (Lunar eclipse.)	Unusual shadow,	Unusual shadow (on Feb 25, the shadow was normal).	Floor glowed with milky light.

Description	Exceptional darkness of crater floor, three light spots noted at foot of E wall. Although no light streaks were visible, there was a large and conspicuous spot near the center. Since this spot has been noted as slightly but definitely rimmed all round, Wilkins suggested that temporary dark cloud or vapor may have covered true floor up to level of rim.	Mist on crater floor.	Bright flash on crater floor near E Wall.	Three brilliant points of light on wall.	Without normal shadow.	Mountain on limb very decidedly bluish.	Bright spots on inner W slopes.	Central peak not seen, but cleft-like marking from SW erest towards E shadow.	Prolongation of southern eusp.	Bright spot on earthlit W limb 30 degrees N of Grimaldi and estimated equal to a 3rd mag star.	Red glow.	Almost featureless apart from Picard, Peirce.	Blurred and misty.	A small bright flash on earthlit portion like a bright sparkle of frost on the ground.	Two areas E of Picard appeared featureless.	Nebulous white patch in place of Quadrangle.
Feature or Location; Duration	Plato	Schiekard	Plato	Darwin	Eratosthenes	SE of Langrenus	Aristarchus	Dawes		30 degrees N of Grimaldi on W limb	NE of Philolaus; 15 min	Mare Crisium; several hours	Promontorium Heraelides	Dark side	E of Picard; several hours	Barker's Quadrangle

Description	Faint point of light.	Spectrum showed UV emission, particularly in region of H and K lines by comparison with spectra of Sun, Mars, and Jupiter.	Activity.	Enhancement of 30 percent at 5450 Å.	Color changes: reddish-orange to ruby patches.	Brightened area, 7th to 11th mag.	Enhancement of large area in red light,	Color changes.	Red spots, then violet, blue haze.	Pink spot on W side.	Red spot in Aristarchus and also on N edge of Anaximander.	Extensive red area,	Purplish-blue patch.	During eclipse, anomalous reddish glow inside umbra. (Lunar eclipse.)	Red flashes, > 12 mag.

Description	Red spot.	Blinks on floors of both craters.	Numerous light streaks on floor, three bright spots on floor, all showed blinks.	Very faint blink on SW floor and another N of it on NW floor (observor considers observation very suspect).	Small blink and suspect faint colored patch in outer W wall in position of original observation of 1966 Apr 30,	Blink just inside the SW floor of crater suspected on elevation NW of dark patch.	Bright red glow in position of suspected blink of 1967 Feb 17. Fading by 20 <sup>h</sup> 37 <sup>m</sup> .	Red color and blink.	Red color under S wall.	Red color outside SE wall.	Red glows.

Description	Aristarchus very bright. Seeing very good until 21h00m UT, after which seeing too bad to continue observing. On April 16 and 17 nothing special was to be seen.	Bright points on S wall, Red patch to NE.	Red color.	Aristarchus so bright that it could be seen with the naked eye.	Red spots on south rim. Moon low.	Elongated blink in crater, SW part of floor.	Red-brown color,	Faint redness outside the NW and SW wall of Gassendi.	Glow in interior of crater.	Black cloud surrounded by violet color.	Bright yellow flash visible a fraction of a second.	Red color observed.

POSTMASTER: If Undeliverable (Section 158 Postal Manual) Do Not Return

"The aeronautical and space activities of the United States shall be conducted so as to contribute . . . to the expansion of human knowledge of phenomena in the atmosphere and space. The Administration shall provide for the widest practicable and appropriate dissemination of information concerning its activities and the results thereof."

— NATIONAL AERONAUTICS AND SPACE ACT OF 1958

## NASA SCIENTIFIC AND TECHNICAL PUBLICATIONS

TECHNICAL REPORTS: Scientific and technical information considered important, complete, and a lasting contribution to existing knowledge.

TECHNICAL NOTES: Information less broad in scope but nevertheless of importance as a contribution to existing knowledge.

TECHNICAL MEMORANDUMS: Information receiving limited distribution because of preliminary data, security classification, or other reasons.

CONTRACTOR REPORTS: Scientific and technical information generated under a NASA contract or grant and considered an important contribution to existing knowledge.

TECHNICAL TRANSLATIONS: Information published in a foreign language considered to merit NASA distribution in English.

SPECIAL PUBLICATIONS: Information derived from or of value to NASA activities. Publications include conference proceedings, monographs, data compilations, handbooks, sourcebooks, and special bibliographies.

TECHNOLOGY UTILIZATION
PUBLICATIONS: Information on technology
used by NASA that may be of particular
interest in commercial and other non-aerospace
applications. Publications include Tech Briefs,
Technology Utilization Reports and Notes,
and Technology Surveys.

Details on the availability of these publications may be obtained from:
